JOURNI MODULES

1

COMPOSITE INDEX

WHY FOUR, NOT ONE

One framework tells you one thing. journi needs four.

Each framework answers a question the other three cannot — together they cover the organization, the individual's skill, the individual's emotional position, and the individual's sentiment.

Lewin

organizational altitude

Is the organization itself unfrozen, changing, or refrozen?

ADKAR

skill altitude

Does this specific cohort have the awareness, desire, knowledge, ability, and reinforcement to actually do the new thing?

Bridges

emotional altitude

Where is this cohort, psychologically, in letting go of the old way and starting the new one?

Kübler-Ross

sentiment altitude

What does this cohort actually feel about the change, right now?

The four frameworks, in journi's own stage vocabulary

Framework	Altitude	Stages (in order)	Logged on
Lewin	Organizational — one reading per project	Unfreeze → Change → Refreeze	M3 (Initiative Registry)
Prosci ADKAR	Individual / cohort — five independently-scored blocks	Awareness → Desire → Knowledge → Ability → Reinforcement	M5 (ADKAR Engine)
Bridges' Transition Model	Individual / cohort — emotional position	Ending → Neutral Zone → New Beginning	M6 (Emotional & Transition Layer)
Kübler-Ross Change Curve	Individual / cohort — sentiment	Denial → Resistance/Anger → Exploration → Commitment	M6 (Emotional & Transition Layer)

Lewin is the only one of the four scored once per project. ADKAR, Bridges, and Kübler-Ross are all scored per cohort, so a single project can carry several distinct readings at once — one per stakeholder group.

Four independent readings, one traceable record

journi never asks a Change Manager to reconcile the four frameworks by hand — every one of them writes to a specific module, and journi's own computed metrics (Section 36) do the reconciliation live.

- › A cohort's Lewin phase (M3) sets the organizational backdrop every other reading is interpreted against.
- › ADKAR (M5) and the emotional layer (M6) are cross-referenced automatically — the Divergence Pattern Detector watches exactly this intersection (Slide 35).
- › The Composite Readiness Index (M14) blends ADKAR and Kübler-Ross with training completion into one number the Steering Committee reviews at every phase gate.
- › No framework is optional: every one of journi's 8 registered transformation-archetype lifecycles logs all four, just weighted differently by archetype (Slide 38).

Lewin's Change Model

The organizational altitude — one reading per project, scored on M3 (Initiative Registry).

Unfreeze

Change

Refreeze

Unfreeze

WHAT IT MEANS

The organization acknowledges the current way of working can no longer hold — the business driver is named, the case for change is made, and the project is registered. Nothing has changed yet; the point is breaking the status quo's grip.

WORKED EXAMPLE

Bouregreg ERP Adoption Program opens Unfreeze in Week 1, justification: "Board-approved business case; three-site manual reconciliation cost is the driver." The Kenitra Automation program opens the same week its narrow, low-resistance scope is confirmed.

IN JOURNI

A CM Project's Lewin macro-state opens at Unfreeze the moment it is created on M1 and saved to M3. Under Bouregreg Group's Governance Setting, opening Unfreeze requires a written justification note, logged to the project's audit trail — not a silent default.

WHAT IT WORKS AGAINST

Denial (Kübler-Ross) and low Awareness (ADKAR) are exactly what Unfreeze is meant to break — this is why Unfreeze rarely opens alone; it is usually accompanied by a first communication wave logged on M8.

Change

WHAT IT MEANS

The actual transition is underway — new processes, systems, structures, or values are being built, piloted, and rolled out. This is the longest of Lewin's three stages in every one of journi's 8 archetype lifecycles.

WORKED EXAMPLE

The Loi 09-08 Compliance Program's Lewin state stays at Change from Week 1 through Week 63 — every one of its seven TPL-COMP-7 phases (regulatory analysis through first monitoring cycle) runs inside this one long Change state.

IN JOURNI

Every Build, Pilot, Rollout, or Implementation phase across journi's 7- and 8-phase templates runs under a Lewin state of Change. A phase-gate closing at M17 does not itself move Lewin — Lewin is a deliberate, justified update on M3.

WHAT IT WORKS AGAINST

This is where ADKAR's Knowledge and Ability blocks are built directly, and where Bridges' Neutral Zone and Kübler-Ross's Resistance/Anger and Exploration stages are most active — Change is the stage every other framework does its heaviest lifting in.

Refreeze

WHAT IT MEANS

The new way of working is locked in as the new normal — not just delivered, but confirmed to hold without active management. This is the stage journi is strictest about: closing it early is the single most common Lewin misuse this guide series warns against.

WORKED EXAMPLE

The Training & Skills program closes Refreeze only in Week 43, after two consecutive sustainment checkpoints confirm the skill holds without active coaching — not at Week 29 when full deployment finished, and not at Week 31 when competency was verified.

IN JOURNI

Refreeze closes only once real evidence — a sustainment checkpoint, a clean monitoring cycle, a certification audit — supports it, never against a calendar date alone. Under Governance Setting, the justification note is mandatory and auditable.

WHAT IT WORKS AGAINST

A population can look "done" — attendance complete, competency verified — while Reinforcement (ADKAR) is still the weakest block. Refreeze closing before Reinforcement is real is exactly how the Operating Model guide's Exception E1 regression happens.

M3 — Initiative Registry

PURPOSE

The system of record for every change initiative — business driver, scope, target population, and Lewin macro-state, one reading per project.

KEY FIELDS

- › Business driver
- › Scope
- › Target population
- › Lewin macro-state (Unfreeze / Change / Refreeze)

WHO CAN EDIT

General write access. A Lewin phase change is a scored/state change, so under Bouregreg Group's Governance Setting it requires a written justification, logged to the project's audit trail — the same discipline applied to every ADKAR and emotional-layer score change.

IN THE BOUREGREG SCENARIO

The Bouregreg ERP Adoption Program's project detail page: Lewin opened at Unfreeze in Part 1, and every later Part of the Master User Guide watches this one field move through Change and toward Refreeze.

What actually closes Refreeze differs by archetype

Lewin's three stages are the same everywhere — but the evidence that justifies moving to Refreeze is archetype-specific, not generic.

Archetype	What Closes Refreeze
ERP	Hypercare exits clean and the Sustain phase's own checkpoint confirms adoption holds.
BPR	Sustainment handoff after rollout, once the resistance record shows no open entries.
Automation	CoE handover, once exception tuning is complete and the bot runs without manual override.
QMS	Never closes in this program's life — certification surveillance runs ongoing, by design.
Cultural	Institutionalization, only once the CRI trend — not the calendar — supports it.
Operating Model	A clean 30-day sustainment checkpoint, after any earlier regression is resolved.
Compliance	The first monitoring cycle confirms controls hold under real operating conditions.
Training & Skills	Two consecutive sustainment checkpoints confirm the skill holds without coaching.

Closing Refreeze Too Early

THE PITFALL

A Change Manager closes Lewin at Refreeze because the project's calendar milestone says the program is "done" — go-live happened, training attendance hit 100%, the rollout finished — without checking whether the underlying ADKAR and emotional-layer readings actually support it.

WHY IT HAPPENS

Refreeze is the stage with the fewest built-in checks: unlike a Phase Gate on M17, nothing in journi blocks a Lewin update on M3 from being saved. The discipline has to come from the Change Manager's own justification-note habit, not from a system lock.

JOURNI'S ANSWER

journi requires a written justification on every Lewin change under Governance Setting — a permanent, auditable trail. The Composite Readiness Index (Slide 36) and a real sustainment checkpoint on M12 are the two pieces of evidence this guide series treats as the minimum bar before Refreeze, not the calendar.

Prosci ADKAR

The individual/cohort altitude — five independently-scored blocks, 1-5 each, on M5 (ADKAR Engine).

Awareness

WHAT IT MEANS

Does this cohort understand why the change is happening at all? Awareness is the floor every other block builds on — a cohort cannot develop real Desire, Knowledge, or Ability for a change it does not yet understand the reason for.

WORKED EXAMPLE

The Compliance program's Awareness reads 2 at baseline (Week 3) — HR, Sales, and Customer Service staff know a data-protection law exists but not what it requires of them specifically. By Week 14, following the regulatory requirement mapping, it reads 4.

IN JOURNI

Scored 1-5 on M5, per cohort. A score of 2 or below requires a mandatory barrier-reason note and auto-escalates — journi will not let a low Awareness score pass silently into the Composite Readiness Index.

WHAT IT WORKS AGAINST

Directly opposes Kübler-Ross's Denial stage — a communications wave logged on M8 is usually the direct lever a Change Manager pulls to move Awareness, which is also the fastest of the five blocks to shift.

Desire

WHAT IT MEANS

Does this cohort actually want to make the change personally, not just understand it intellectually? Desire is the block most exposed to "what's in it for me" — and the one most likely to stall on a specific, named fear.

WORKED EXAMPLE

One Bouregreg's Tangier Dispatch cohort logs a Desire score of 2 in Week 25, with the barrier note: "Recurring fear about job security post-integration, first surfaced in Week 7 diagnosis, unresolved" — triggering the program's own Exception E2.

IN JOURNI

Scored 1-5 on M5. Because a Desire stall is almost always tied to a specific, nameable fear, its barrier-reason note (mandatory below 2) is the field this guide series' exception write-ups quote most often verbatim.

WHAT IT WORKS AGAINST

The archetype most dependent on Desire is Cultural — the Tangier integration case's Exception E2 (Desire Stall) is a direct, named fear ("recurring fear about job security post-integration") logged straight from this field.

Knowledge

WHAT IT MEANS

Does this cohort know **how** to do the new thing — the specific steps, not just that a change is coming? Knowledge is what training (M9) is built to produce, and it is the first of the five blocks a curriculum can move directly.

WORKED EXAMPLE

The Training & Skills program's Knowledge score climbs sharply during Training Delivery (Weeks 15-29), moving from 1 at baseline to 4 by the time full two-plant deployment closes — the direct, intended effect of the curriculum.

IN JOURNI

Scored 1-5 on M5, and cross-referenced automatically with M6's Bridges reading — Knowledge climbing while Bridges still reads "Ending" is exactly the combination ALT-001 (Divergence Pattern Detected) is built to catch.

WHAT IT WORKS AGAINST

Training completion logged on M9 is the direct evidence a Change Manager cites when raising a Knowledge score — this is the block with the tightest, most auditable link to a specific journi module outside M5 itself.

Ability

WHAT IT MEANS

Can this cohort actually perform the new behavior under real conditions — not just describe it? Ability is Knowledge tested against reality, and the gap between the two is exactly what a pilot cohort or shadow-mode period is designed to surface.

WORKED EXAMPLE

The Automation program's Kenitra AP cohort reaches Ability 4 by Week 32, confirmed through two weeks of shadow-mode running the bot alongside the manual process — not assumed from training completion alone.

IN JOURNI

Scored 1-5 on M5. Ability is the second input, alongside Knowledge, that ALT-001's Divergence Pattern Detector watches — both at 4 or above while Bridges reads "Ending" signals a cohort that has learned but not yet emotionally moved.

WHAT IT WORKS AGAINST

This is the block a Practical Application phase (as in the Training & Skills archetype) or a UAT/shadow-mode period (Automation) is purpose-built to raise — competency verification exists specifically to confirm Ability, not just attendance.

Reinforcement

WHAT IT MEANS

Does the new behavior hold once active support stops?
Reinforcement is the slowest-moving, most decay-prone block — and the one this guide series treats as the true test of whether a program actually finished, not just delivered.

WORKED EXAMPLE

The Training & Skills program engineers Reinforcement deliberately through two dedicated phases — Practical Application and On-the-Job Coaching — rather than leaving it to chance, the only archetype in the series to do so explicitly.

IN JOURNI

Scored 1-5 on M5, and the direct input alongside a clean M12 sustainment checkpoint that justifies closing Lewin at Refreeze. A program can score 4-5 on every other block and still fail here.

WHAT IT WORKS AGAINST

This is the block the Operating Model guide's Exception E1 shows failing in real time — a function head reverts to old decision-making under operational pressure precisely because Reinforcement, not Knowledge or Ability, was never engineered.

M5 — ADKAR Engine

PURPOSE

Score cohorts across the five ADKAR blocks — Awareness, Desire, Knowledge, Ability, Reinforcement — with mandatory barrier-point diagnosis on any low score.

KEY FIELDS

- › Five block scores, 1-5 each: Awareness, Desire, Knowledge, Ability, Reinforcement
- › A barrier-reason note, mandatory on any score of 2 or below

WHO CAN EDIT

General write access, with a mandatory justification on every score change under Bouregreg Group's Governance Setting — the same auditable discipline Lewin and the emotional layer both apply.

IN THE BOUREGREG SCENARIO

Driss El Amrani logs the Bouregreg ERP program's baseline ADKAR pulse here in Week 1, then re-scores each block through the program's Build, Test, and Train phases as training and go-live proceed.

A worked example: three sites, one blended number

The Bouregreg ERP program's Composite Readiness Index reads a misleading blend until it is disaggregated by site — the exact failure mode Exception E6 (Cohort Divergence Across Sites) is built to catch.

Site	Knowledge	Ability	Bridges Reading	What It Signals
Casablanca	4	4	New Beginning	Genuinely ready — proximity to the program team helped.
Kenitra	3	3	Neutral Zone	On track, following recovery from an earlier E4 regression.
Settat	2	2	Ending	Behind, following the E1 Desire stall — needs a second training wave.

One blended M14 reading (78% / 68% / 54% disaggregated) would have hidden Settat's real gap entirely — the reason this guide series treats per-cohort ADKAR scoring, not a single project-level average, as the non-negotiable unit of analysis.

Averaging Away a Cohort's Real Gap

THE PITFALL

A Change Manager reports one project-level ADKAR average to the Steering Committee, blending a strong site or department with a struggling one — the strong number masks the struggling one instead of surfacing it.

WHY IT HAPPENS

M14's Composite Readiness Index is computed at the project level by default, and a single clean-looking number is easier to report than three uneven ones — the path of least resistance in a status meeting is exactly the path that hides the real risk.

JOURNI'S ANSWER

M4's Stakeholder Mapping carries site/department tags precisely so a Change Manager can disaggregate M14's blended number by cohort at any time — the Bouregreg ERP program's own Exception E6 shows this disaggregation step performed explicitly, not left implicit.

Bridges' Transition Model

The emotional altitude — where a cohort stands, psychologically, in letting go and starting over. Logged on M6.

Ending

WHAT IT MEANS

The cohort has not yet let go of the old way of working, psychologically — even if they can already describe the new one. Ending is about loss, not information, and it is the stage most often mistaken for simple resistance.

WORKED EXAMPLE

The Bouregreg ERP program's Casablanca finance cohort reads Ending through most of Build, even as their Knowledge score climbs to 4 — ALT-001 fires at Week 28, correctly flagging the gap before it reaches go-live.

IN JOURNI

Scored on M6, alongside a justification note. Ending is the specific Bridges reading ALT-001's Divergence Pattern Detector watches for, paired against high Knowledge and Ability on M5 — the combination that signals a cohort trained but not yet emotionally moved.

WHAT IT WORKS AGAINST

A cohort can score 4-5 on Knowledge and Ability while still reading Ending on Bridges — this is not a contradiction in the data, it is the exact real-world pattern of someone who has learned a skill but not yet accepted why the old one had to go.

Neutral Zone

WHAT IT MEANS

The old way is gone, the new way is not yet fully trusted or habitual — a genuinely uncomfortable, in-between state. Bridges treats this as necessary, not a problem to rush past; real transition happens here, not around it.

WORKED EXAMPLE

The Operating Model program's Function Heads read Neutral Zone from Week 48 (detailed org design) through the pilot transition at Week 52 — deliberately not rushed to New Beginning until the pilot site's own evidence supports it.

IN JOURNI

Scored on M6. This is the longest-held Bridges reading across every one of journi's 8 archetype lifecycles — most cohorts spend more calendar time in Neutral Zone than in either Ending or New Beginning.

WHAT IT WORKS AGAINST

Rushing a cohort out of Neutral Zone before Reinforcement (ADKAR) is real is a direct path to the Operating Model guide's Exception E1 — a premature "New Beginning" reading that reverts under the first real operational pressure.

New Beginning

WHAT IT MEANS

The cohort has genuinely adopted the new identity, not just the new process — they describe themselves, unprompted, in terms of the new way of working. This is the emotional counterpart to Lewin's Refreeze.

WORKED EXAMPLE

The QMS program's Settat quality function reaches New Beginning only after the certifying audit passes clean in Week 46 — not at mock-up audit (Week 38), when the reading was still provisionally Neutral Zone pending real external validation.

IN JOURNI

Scored on M6. Like Refreeze, journi treats a New Beginning reading claimed without supporting evidence as a real risk — this guide series consistently pairs it with a sustainment checkpoint on M12, not the reading alone.

WHAT IT WORKS AGAINST

A New Beginning reading that later reverts to Neutral Zone or Ending is exactly what a regression checkpoint (M12) is built to catch — the Operating Model program's Exception E1 shows precisely this reversal, caught and logged rather than hidden.

M6 — Emotional & Transition Layer (Bridges half)

PURPOSE

Bridges transition position, cross-referenced automatically with ADKAR — the module where journi's Divergence Pattern alert gets its second input.

KEY FIELDS

- › Bridges stage: Ending / Neutral Zone / New Beginning
- › A justification note on every stage change

WHO CAN EDIT

General write access; individual-level detail restricted the same way as M4 and M5 — visible only to Super Admin, Group Admin, Org Admin, Change Manager, and People Manager roles.

IN THE BOUREGREG SCENARIO

This is where the Bouregreg ERP program's Divergence Pattern alert actually gets its second input — if Knowledge and Ability read high on M5 while Bridges is still logged Ending here, the two modules together are what ALT-001 is watching.

Rushing Past the Neutral Zone

THE PITFALL

A Change Manager marks a cohort "New Beginning" the moment go-live happens or training completes — treating Bridges as a calendar milestone rather than a genuine emotional state that has to actually be reached.

WHY IT HAPPENS

Neutral Zone is uncomfortable to sit in, for the cohort and for whoever is reporting status upward — a Steering Committee wants to hear "we've arrived," and New Beginning sounds better in a status readout than an honest Neutral Zone reading.

JOURNI'S ANSWER

journi requires a justification note on every Bridges change, the same auditable discipline as Lewin and ADKAR — and this guide series consistently pairs a New Beginning claim with a real M12 sustainment checkpoint, never the reading in isolation.

Kübler-Ross Change Curve

The sentiment altitude — a simplified four-stage model of how a cohort actually feels. Logged on M6, alongside Bridges.

Denial

WHAT IT MEANS

The cohort does not believe the change is really happening, or that it applies to them specifically — a sentiment state, distinct from ADKAR's Awareness, which measures understanding rather than belief.

WORKED EXAMPLE

The Kenitra Automation program's AP staff never register Denial at all — a narrow, well-scoped project with an already-bought-in team starts past this stage, part of why the program closes without any alert firing.

IN JOURNI

Logged on M6 alongside Bridges. Denial is the sentiment counterpart to Lewin's Unfreeze stage — both describe the same early moment from a different altitude, organizational versus individual.

WHAT IT WORKS AGAINST

A first communications wave (M8) is the direct lever for moving a cohort out of Denial, the same lever used against low Awareness — the two are related but not identical, which is exactly why journi tracks them as separate fields.

Resistance / Anger

WHAT IT MEANS

The cohort actively pushes back — verbally, in behavior, or by working around the new way rather than adopting it. journi treats this as real, trackable data, not a discipline problem to suppress.

WORKED EXAMPLE

The BPR guide's Order-to-Cash program logs its third open resistance entry during the Weeks 20-24 pilot, firing ALT-004 — resolved through a co-designed accuracy safeguard the resisting staff themselves helped define.

IN JOURNI

This sentiment stage is the direct counterpart to the Resistance Log on M10 — three or more open entries there is what fires ALT-004 (Resistance Escalation Threshold Breached), the alert most directly tied to this Kübler-Ross stage.

WHAT IT WORKS AGAINST

A BPR-type program is the archetype most built around this stage by design — the Order-to-Cash Process Redesign case is engineered so finance staff who privately own today's manual workarounds resist a redesign that makes those workarounds obsolete.

Exploration

WHAT IT MEANS

The cohort starts testing the new way of working, tentatively — trying it out rather than fighting it, but not yet fully committed either. This is where genuine curiosity starts to outweigh resistance.

WORKED EXAMPLE

The Training & Skills program's Kenitra pilot cohort moves into Exploration during Weeks 15-19, the same window their hands-on delivery runs — sentiment and skill development advancing together, not sequentially.

IN JOURNI

Logged on M6. Exploration typically overlaps with Bridges' Neutral Zone — the two frameworks describe the same in-between period from the emotional-position angle (Bridges) and the sentiment angle (Kübler-Ross) respectively.

WHAT IT WORKS AGAINST

A pilot cohort, in any archetype, is specifically designed to happen during Exploration — the QMS program's mock-up audit, the Automation program's shadow-mode period, and the Training & Skills program's pilot delivery all land here by design.

Commitment

WHAT IT MEANS

The cohort genuinely embraces the new way of working and would choose it again — the sentiment counterpart to Bridges' New Beginning and Lewin's Refreeze, completing the same emotional arc from a third angle.

WORKED EXAMPLE

The Compliance program's HR, Sales, and Customer Service cohorts reach Commitment by the first monitoring cycle (Week 52) — verified not by self-report but by controls holding under real operating conditions for the first time.

IN JOURNI

Logged on M6. Commitment is one of the two direct inputs (alongside training completion) to the Composite Readiness Index's Kübler-Ross-sentiment term — a real, weighted 25% of the number the Steering Committee reviews at every phase gate.

WHAT IT WORKS AGAINST

A Commitment reading that has not been tested against real operating pressure is exactly the risk a sustainment checkpoint on M12 exists to catch — the same discipline applied to a premature New Beginning or Refreeze claim.

M6 — Emotional & Transition Layer (Kübler-Ross half)

PURPOSE

Kübler-Ross sentiment, cross-referenced with ADKAR and Bridges — a 25% weighted input to the Composite Readiness Index.

KEY FIELDS

- › Kübler-Ross sentiment: Denial / Resistance-Anger / Exploration / Commitment
- › A justification note on every sentiment change

WHO CAN EDIT

General write access; individual-level detail restricted the same way as M4 and M5 — visible only to Super Admin, Group Admin, Org Admin, Change Manager, and People Manager roles.

IN THE BOUREGREG SCENARIO

One module, two frameworks: M6 carries both the Bridges transition stage and the Kübler-Ross sentiment reading side by side, each independently scored and justified — not a single blended emotional field.

Treating Resistance as a Problem to Suppress

THE PITFALL

A Change Manager reads a Resistance/Anger sentiment, or open entries on the Resistance Log, as something to shut down quickly — closing entries without addressing the underlying cause, or discouraging staff from raising concerns at all.

WHY IT HAPPENS

Resistance feels, to a program under schedule pressure, like an obstacle to route around rather than data to use — closing the log entry looks like progress, even when the underlying cause is still live and will resurface later.

JOURNI'S ANSWER

journi's ALT-004 fires specifically to force attention at three open entries, before resistance becomes unmanageable — and this guide series' own BPR case shows the better path: a co-designed recovery, built with the resisting staff, not around them.

The Framework Interaction Map: how a single cohort is read at once

journi's own Framework Interaction Map (v2.3) traces exactly how a signal in one framework propagates to the others — not four disconnected scores.

Lewin

Change

ADKAR

Know. 4 / Abil. 4

Bridges

Ending

Kübler-Ross

Exploration

Read together, not separately: Change + high Knowledge/Ability + Ending + Exploration is a cohort that has learned the new skill and started experimenting with it, but has not yet let go of the old identity — exactly the pattern ALT-001 is built to surface, before it reaches go-live.

WORKED EXAMPLE

ALT-001: Divergence Pattern Detected

The one alert computed directly, live, from two frameworks at once — not a single-module trigger.

THE COMPUTED RULE

Knowledge ≥ 4 AND Ability ≥ 4 on M5, while Bridges reads exactly "Ending" on M6, for the same cohort.

Severity: High · Escalation: L2 — Change Manager · SLA: acknowledge within 48h

It is not a separate module — it is computed live from M5 and M6 data and surfaces exclusively as ALT-001 in the Notification Center.

WHY THIS COMBINATION MATTERS

A cohort can be fully trained and technically capable, and still not have emotionally accepted the old way is gone. Attendance and competency data alone would miss this entirely — only the Bridges cross-reference surfaces it.

Real case: the Bouregreg ERP program's Casablanca finance cohort fires ALT-001 at Week 28 (Test phase) — Exception E2 in the Master User Guide, caught and resolved before go-live rather than discovered after.

One number, three inputs, recalculated live

$$\text{ADKAR\%} \times 0.50 + \text{Kübler-Ross sentiment\%} \times 0.25 + \text{Training completion\%} \times 0.25$$

Computed on M14 (Analytics) · Recalculated live as any of its three inputs change

50%

ADKAR

The five-block score, per cohort — the heaviest-weighted input, since it directly measures whether people can actually do the new thing.

25%

Kübler-Ross Sentiment

How the cohort feels right now — a real, not cosmetic, quarter-weight in the final number.

25%

Training Completion

Logged on M9 — the one input that is not itself a framework score, grounding the index in a concrete, auditable fact.

Reading the CRI trend, not just the number

M14's benchmarking view reads a project's CRI trend against the pace this guide series treats as expected for its archetype and week — In Line, Ahead, or Behind.

In Line

The CRI trend tracks the expected curve for this archetype and week — the default, unremarkable reading most weeks should show.

Ahead

The CRI trend outpaces the expected curve — worth naming explicitly rather than assuming it will simply continue, since an early lead can mask a later-surfacing gap (as in Exception E6's disaggregation).

Behind

The CRI trend lags the expected curve — the reading that should trigger a specific recovery task, not just a note for the next status meeting.

WEIGHTING DIFFERS BY ARCHETYPE

The same four frameworks, read with different emphasis

journi logs all four frameworks on every one of its 8 registered transformation-archetype lifecycles — but which one dominates the real risk differs by type.

Archetype	Dominant Framework(s)	Why
ERP	ADKAR + Lewin	A system cutover needs both organizational readiness and individual capability at once.
BPR	Kübler-Ross	Staff privately own the workarounds being redesigned away — resistance is the central risk.
Automation	ADKAR (light touch)	A narrow, low-resistance scope means all four frameworks read favorably from the start.
QMS	Lewin (Refreeze never closes)	Certification surveillance runs ongoing — the organizational state never fully "sets."
Cultural	Bridges + Kübler-Ross	Identity and emotional integration matter more than any specific skill.
Operating Model	ADKAR Reinforcement	Reversion under operational pressure, not initial adoption, is the real risk.
Compliance	ADKAR (Awareness + Ability)	Checkable behaviors matter; Desire matters far less than in any other archetype.
Training & Skills	ADKAR (all five blocks)	The entire program exists to move a population through the ADKAR arc itself.

WHICH MODULES EACH FRAMEWORK TOUCHES

A quick cross-reference

Framework	Primary Module	Feeds Into
Lewin	M3 (Initiative Registry)	Phase Gate context on M17; the organizational backdrop for every other reading
ADKAR	M5 (ADKAR Engine)	M14's Composite Readiness Index (50% weight); ALT-001's Knowledge/Ability input
Bridges	M6 (Emotional & Transition Layer)	ALT-001's emotional-position input; sustainment evidence for Refreeze
Kübler-Ross	M6 (Emotional & Transition Layer)	M14's Composite Readiness Index (25% weight); ALT-004 via the Resistance Log (M10)

Training completion (M9), the CRI's third input, is the one piece of evidence in the index that is not itself a framework score — a deliberate design choice keeping the index grounded in something concrete and auditable.

Which of the 9 live alerts trace to which framework

Alert	Framework Link
ALT-001 Divergence Pattern Detected	ADKAR (Knowledge, Ability) + Bridges (Ending) — computed jointly
ALT-002 Regression Risk Score Critical	ADKAR Reinforcement, via a High-risk M12 sustainment checkpoint
ALT-003 Sponsor Coverage Gap	Not a framework score directly — damages Bridges and Kübler-Ross fastest
ALT-004 Resistance Escalation Threshold Breached	Kübler-Ross (Resistance/Anger), via the Resistance Log (M10)
ALT-008 Change Saturation Threshold Breached	Portfolio-level — not tied to a single framework
ALT-009 Phase Gate No-Go / Conditional	Lewin — a Phase Gate is the organizational-transition checkpoint
ALT-010 Guiding Coalition Gap	Not a framework score directly — a Sponsor & Coalition (M7) structural gap
ALT-011 Communication Overload Detected	Portfolio-level — not tied to a single framework
ALT-015 Sustainment Sign-Off Blocked	ADKAR Reinforcement + Lewin Refreeze, blocked until the regression clears

What each stakeholder should actually watch

Change Manager

The Notification Center bell first, then M14 for the trend behind whatever fired — the day-to-day owner of all four frameworks.

**Executive Sponsor /
Steering Committee**

M14's benchmarking view for the blended readiness trend; ALT-003, ALT-004, ALT-009, and ALT-010 name them directly as a recipient.

PMO / Program Manager

ALT-008 and ALT-009 are PM-facing by design — saturation and gate outcomes are portfolio- and schedule-level concerns first.

Super Admin

None of the 9 live alerts route here by default; their standing responsibility is tenant configuration, not day-to-day alert triage.

Four lenses. One traceable record.

journi never asks anyone to reconcile Lewin, ADKAR, Bridges, and Kübler-Ross by hand — every reading is scored, justified, and computed into one auditable picture.
